InfoCenter

Short Project Documentation

Team 17 — ByteSquad | Introduction to Software Engineering | Mae Fah Luang University

1. What is InfoCenter?

InfoCenter brings social-media updates from selected pages into one place. It is designed for students and newcomers who may miss important announcements because information is spread across different platforms.

2. Main Features

- **Add sources:** Paste a supported Facebook, Instagram, or TikTok page link.
- **One combined feed:** View posts from selected sources together and open the original post.
- **Tags and filters:** Group sources with labels such as #MFU or #TechNews.
- **Keyword search:** Include topics you want and exclude words you do not want to see.
- **Organize posts:** Use All, Important, Unread, and Bookmarked tabs; sort by newest or oldest.
- **Personalize:** Switch between Thai and English and between light and dark themes.

3. How It Works

A user adds a page link → InfoCenter retrieves or displays available posts → the user searches, tags, and filters the feed → the user opens the original post when needed.

In the current project, the interface can use sample (mock) data when a working backend is not available. Therefore, live collection of posts depends on backend and platform access.

4. Technology (for technical readers)

Frontend: React 18, TypeScript, Vite 5, Tailwind CSS 3, and lucide-react icons. The frontend uses a REST API client for /api endpoints and includes mock-data fallbacks. The repository also contains a C# backend project for reading and processing Apify dataset data.

5. Run the Frontend Locally

1. Install Node.js 18 or later.
2. Extract the project ZIP and open the project folder in a terminal.
3. Run: npm install
4. Copy .env.example to .env (if needed for your setup).
5. Run: npm run dev
6. Open the local address printed by Vite in your browser (the README specifies http://localhost:3000).

6. Current Scope and Limitations

- The intended supported sources are Facebook, Instagram, and TikTok.
- InfoCenter displays source content and links users back to the original post; it is not intended to replace those platforms.
- Automatic updates depend on available APIs/data access and a correctly running backend.
- The README reports that automated tests are not yet implemented; type-checking and production-build commands are available.

- Notifications while the app is closed and built-in commenting are outside the stated project scope.

7. Quick Commands

Command	Purpose
npm run dev	Start the development server
npm run lint	Check TypeScript types without building output
npm run build	Check and build the frontend for production
npm run preview	Preview the production build locally

In one sentence: InfoCenter helps people find important updates from multiple social pages without checking each page separately.
